# **Chapter 3**

**Case Studies** 

## **Case Study Focus**

- Applications generally can be divided into 3 layers
  - User interface
  - Application logic
  - Other components/layers
- Focus on application logic layer because:

## Sample Layers & Objects in OO System The FOO Store \_ 🗆 × Item ID minor focus User Interface explore how to connect to Enter Item And so on . . . other layers primary focus of case studies application Sale Payment logic layer explore how to design objects other layers or secondary Database Access ... Logging ... components focus

## **Learning Path Following Iterations**

Introduces just those analysis and design

skills related to

iteration one.

Additional analysis and design skills introduced.

Iteration 2

Iteration 3

Likewise.

## Case Study I: NextGen POS System

- NextGen point-of-sale (POS) system
  - Computerized application used (in part) to record sales and handle payments typically used in a retail store
- Components
  - Hardware: computer and bar code scanner etc.
  - Software
- Interfaces to various service applications, such as a thirdparty tax calculator and inventory control
- Must be relatively fault-tolerant
  - Even if remote services are temporarily unavailable (such as the inventory system), they must still be capable of capturing sales and handling at least cash payments
- Increasingly must support multiple and varied client-side terminals and interfaces
  - Thin-client Web browser terminal
  - Regular personal computer with graphical user interface
  - Touch screen input
  - Wireless PDAs, etc.

## Case Study I: NextGen POS System

- Sold to different clients with disparate needs in terms of business rule processing
- Each client will desire a unique set of logic to execute at certain predictable points in scenarios of using the system, such as
  - When a new sale is initiated.
  - When a new line item is added
- Need a mechanism to provide flexibility and customization.
- Using an iterative development strategy, we are going to proceed through requirements, object- oriented analysis, design, and implementation.

## **Case Study II: Monopoly Game System**

- Domain and requirements not at all like business system such as the NextGen POS
- Still relevant and useful:
  - Domain modeling
  - Object design with patterns
  - Applying the UML
- Run as a simulation.
  - One person starts the game
  - Indicate number of simulated players
  - Watch while the game runs to completion
  - Presenting a trace of activity during simulated player turns
